PRODUCT + TECHNICAL PITCH

Pappu

പപ്പു

Your voice-first personal finance companion

MALAYALAM · MANGLISH · ENGLISH

01 · THE FRICTION

Money happens in conversation. Tracking it still happens in forms.

TODAY: LUNCH WITH A FRIEND

- Open the app, find the right screen
- Type the amount, pick a category, set the date
- Log the friend's share separately
- Later, scroll and search to answer “how much on food?”

WITH PAPPU: JUST SAY IT

“ബിരിയാണി കഴിച്ചു, 300 rupees”

Natural speech, in the language people actually use — Malayalam, Manglish or English.

02 · THE PRODUCT

Speak naturally. See the result.

1 · Speak

Hold the coin and talk, or type — in Malayalam, Manglish or English.

2 · Interpret

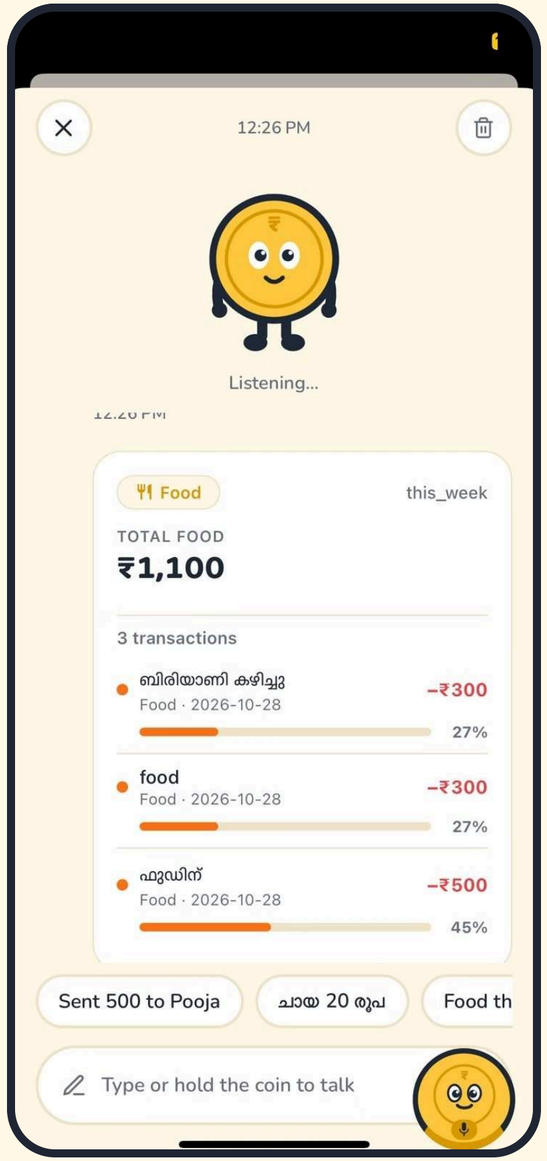

Speech becomes text; Pappu turns it into a small structured plan.

3 · Act safely

Backend code validates and runs the action — or asks when unsure.

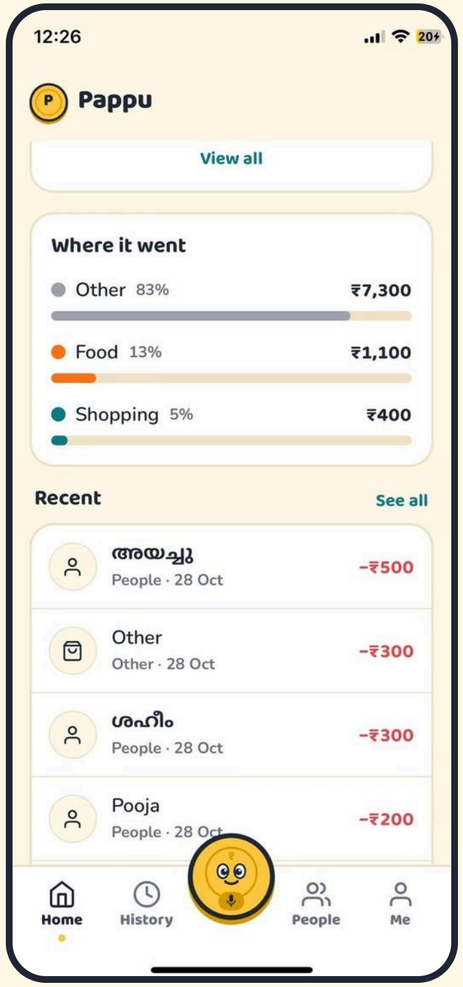

4 · Answer

A clear reply and result card, with the mascot reflecting each state.

REAL APP · LISTENING + FOOD QUERY RESULT

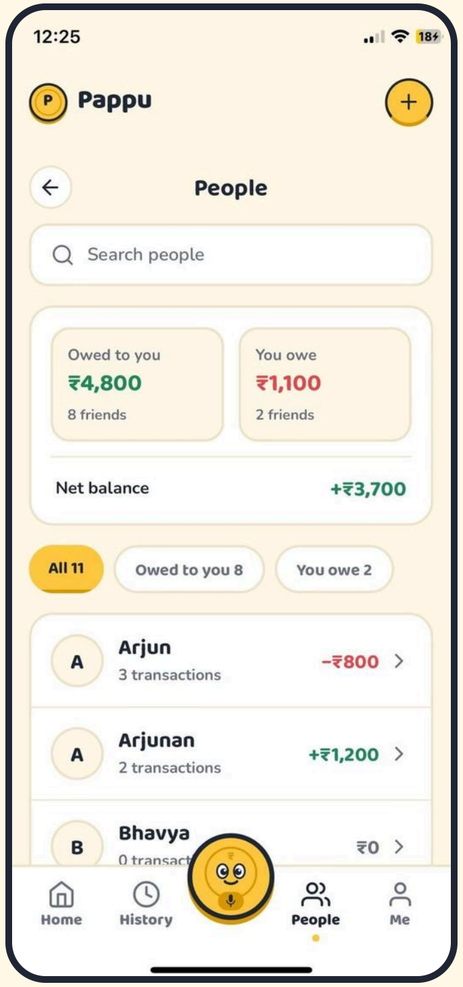

Every screen answers one money question

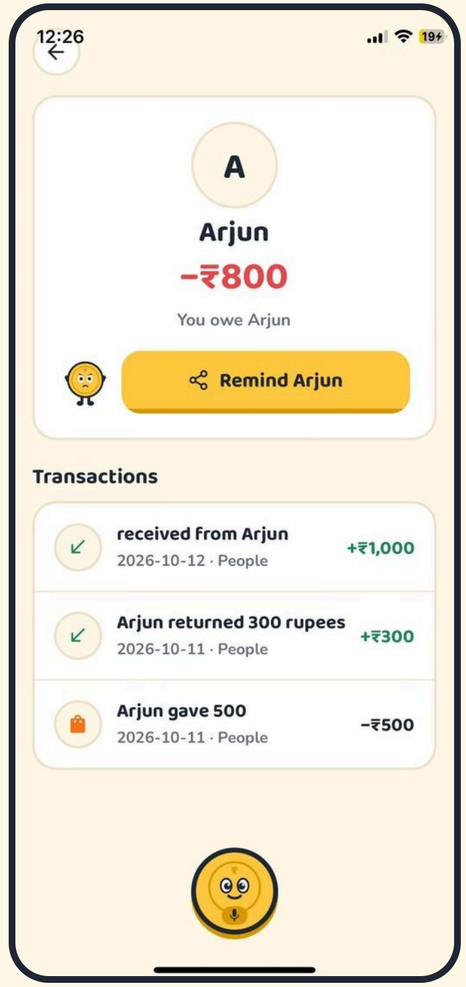

WHERE DID IT GO?

WHAT DID I RECORD?

WHO OWES WHOM?

WHAT'S MY HISTORY WITH ARJUN?

04 · ONE USER JOURNEY (ILLUSTRATIVE)

Add an expense, then correct it

“I spent ₹250 on lunch yesterday.” … “Change it to ₹300.”

USER SAYS

Two short voice turns. Speech is transcribed to text before Pappu interprets it.

PAPPU DETERMINES

Turn 1: an add — ₹250, Food, yesterday. Turn 2: an edit on the transaction just touched.

BACKEND CHECKS

Schema + sanitizer. Resolver searches only this user's records. Many matches → asks which. Not recent → asks to confirm.

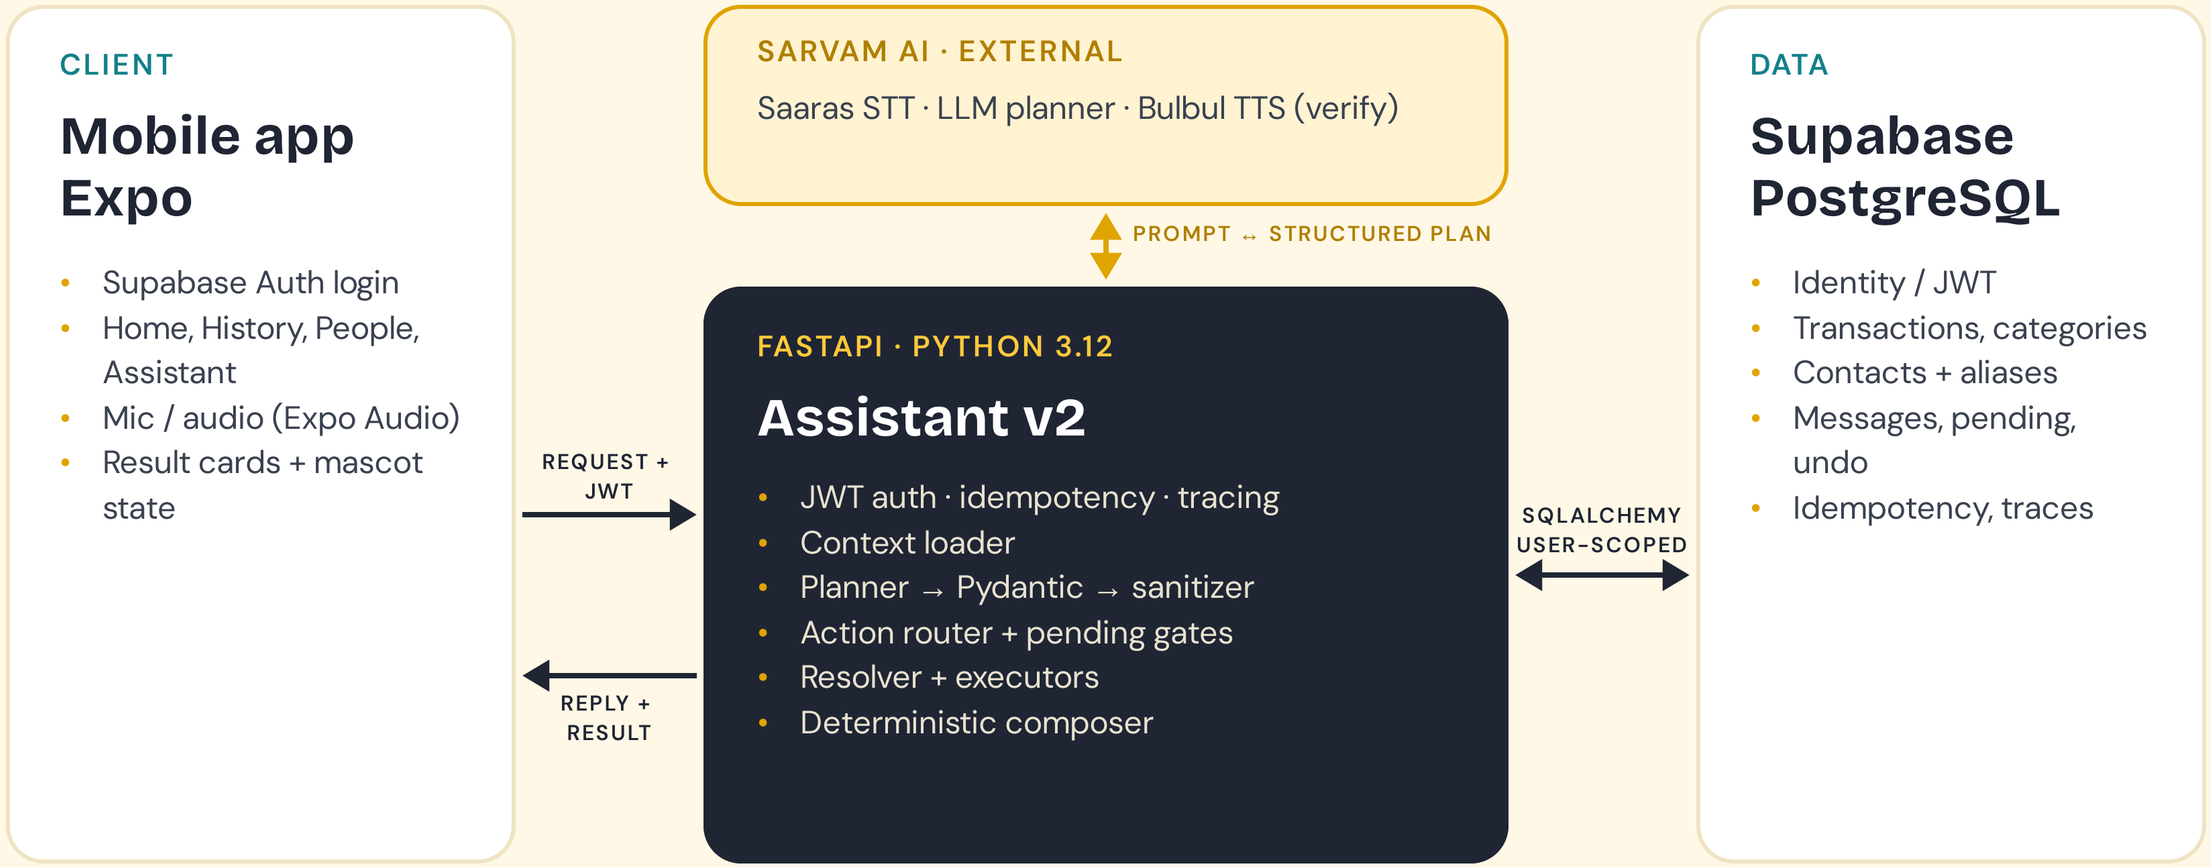

USER SEES

A clear reply in ₹, the updated card, and an undo record for the change.

ILLUSTRATIVE STORY, NOT A CAPTURED SESSION. ACTIONS MAY COMMIT INDIVIDUALLY — NOT AN ATOMIC TRANSACTION.

05 · SYSTEM ARCHITECTURE

The model plans. Backend code acts.

THE LLM NEVER TOUCHES THE DATABASE — ONLY BACKEND EXECUTORS READ OR WRITE DATA. SPEECH PATH PLACEMENT (APP VS BACKEND) TO VERIFY WITH OWNER.

06 · INSIDE THE ASSISTANT

One request, four deterministic guardrails around one model call

01
Context
Auth user, IST date, contacts, recent messages, last-touched, pending.

→

02
Plan (LLM)
Sarvam LLM proposes up to 5 typed actions. Retry once, else clarify.

→

03
Validate + route
Pydantic + sanitizer, then add / edit / delete / query / undo / chat.

→

04
Execute + reply
Resolver, Python executors, DB commit, composer formats ₹ reply.

ONLY STEP 02 CALLS A MODEL

Short yes/no answers to a pending action take a fast path with no LLM call. The final reply is composed by code, not a second model call.

07 · TRUST AND SAFETY

When unsure, Pappu asks instead of guessing

User-scoped data

JWT identifies the user; context and queries are filtered by that user ID.

Validated plans

Pydantic schema plus a sanitizer check every plan before anything runs.

Disambiguation

Several matching transactions? Pappu asks which one — never picks at random.

Confirmations

Delete always asks. Edit asks when the target isn't recent or recently touched.

Idempotency

A repeated request returns the saved response instead of running twice.

Undo

Reverses the latest supported action batch from recorded prior state.

GATES VARY BY ACTION AND CONTEXT. NOT EVERY OPERATION IS UNDOABLE. TABLE-LEVEL RLS: VERIFY WITH OWNER.

08 · PRODUCT BREADTH

More than a logger: an assistant that acts

VOICE-FIRST · MULTILINGUAL

Malayalam, Manglish and English

Hold the coin to talk or type. Sarvam speech services handle transcription.

INCOME + EXPENSES

Amounts, dates, categories and details; weekly, monthly and yearly views.

PEOPLE + BALANCES

Track money sent and received; owed-to-you, you-owe and net balance.

HISTORY

Browse and search every recorded transaction.

EDIT · DELETE · UNDO

Fix records by voice, with confirmations and undo where supported.

NATURAL-LANGUAGE QUERIES

“How much on food this week?”

Totals, lists, counts, biggest transactions and comparisons — plus a mascot that shows listening, thinking and speaking.

09 · CURRENT STATUS

What's working today ?

SHOWN IN REAL SCREENSHOTS

- Home dashboard: weekly spend, daily chart, category split
- Voice assistant: listening state + food query card
- Transaction history with Malayalam entries
- People balances and per-contact detail
- Assistant v2 backend: planner, resolver, executors, composer

WHY PAPPU

Just say it. Pappu keeps track.

Personal finance in your own words — with code that checks before it acts.

Low friction

Speak instead of filling forms.

Your language

Malayalam, Manglish and English.

Acts, not chats

Adds, edits, queries and undoes records.

Safe by design

Deterministic execution and explicit gates.
